### Lecture 9

$$? a^2 + b^2 = c^2 ?$$

$$y = mx + b \quad ? \quad d = rt$$

Suppose  $A(x_1, y_1)$  &  $B(x_2, y_2)$

Slope of the line  $\overleftrightarrow{AB}$  is  $m$ , where

$$m = \frac{\text{Rise}}{\text{Run}}$$

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

Draw a line that contains  $A(-3, 2)$  with

Slope  $\frac{4}{5} \cdot \frac{\text{Rise}}{\text{Run}}$

Draw the line that contains (2,6) with slope  $-\frac{3}{5}$ .

$$\frac{-3}{5} \quad \begin{array}{l} \text{Rise} \\ \hline \text{Run} \end{array}$$

Draw two lines with slope  $\frac{2}{7}$ , one contains (0,3), other one contains (0,-4).

Same Slope

Draw two lines that contain (4,0), one with slope  $\frac{4}{3}$ , other one with slope  $-\frac{3}{4}$ .

whenever **Product** of slopes is **-1**, the

Slant lines are

**Perpendicular.**

$$\frac{4}{3} \cdot \frac{-3}{4} = \frac{-12}{12}$$

$$= -1$$

Draw  $\overleftrightarrow{AB}$  where  $A(-6,2)$  and  $B(3,6)$ .

$$m = \frac{4}{9}$$

$(-6, 2) \rightarrow (3, 6)$

$$m = \frac{y_1 - y_2}{x_1 - x_2} = \frac{2 - 6}{-6 - 3} = \frac{-4}{-9}$$

$$= \boxed{\frac{4}{9}}$$

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{6 - 2}{3 - (-6)} = \boxed{\frac{4}{9}}$$

Draw  $\overleftrightarrow{AB}$  with  $A(0,5) \neq B(4,0)$ .

$$(0,5) \neq (4,0)$$

$$m = \frac{5 - 0}{0 - 4}$$

$$= \frac{5}{-4} = \boxed{\frac{-5}{4}}$$

Draw  $\overleftrightarrow{AB}$  with  $A(-8,-3) \neq B(0,3)$ .

$$m = \frac{6}{8} = \boxed{\frac{3}{4}}$$

$$(-8,-3) \neq (0,3)$$

$$m = \frac{-3 - 3}{-8 - 0}$$

$$= \frac{-6}{-8} = \frac{6}{8} = \boxed{\frac{3}{4}}$$

$m = 0 \iff$  Horizontal line  $\iff y = b$   
 undefined slope  $\iff$  Vertical line  $\iff x = a$

Slope-Int Form

$$y = mx + b$$

Y-Int  $(0, b)$

Slope  $m$

$$y = \frac{3}{5}x - 1$$

Y-Int  $(0, -1)$ ,  $m = \frac{3}{5}$

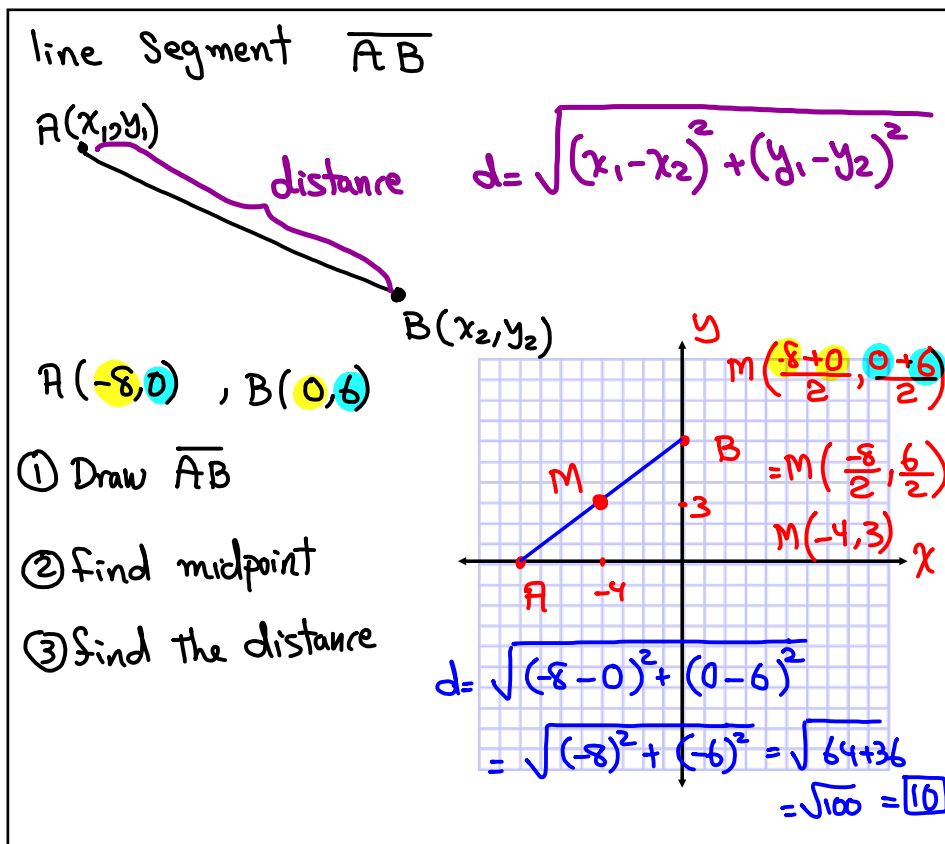

Consider  $y = -\frac{2}{3}x + 4$ .

Y-Int  $(0, 4)$

Slope  $-\frac{2}{3}$  Rise Run

Draw

A(-6,4), B(6,-4)

① Draw  $\overline{AB}$

② Find its midpoint M

③ find its distance

④ find its slope

$$m = \frac{-8}{12} = \boxed{\frac{-2}{3}}$$

$$\begin{aligned} d &= \sqrt{(-6-6)^2 + (4-(-4))^2} \\ &= \sqrt{(-12)^2 + 8^2} \\ &= \sqrt{144 + 64} = \sqrt{208} \\ &\approx \boxed{14.42} \end{aligned}$$

The sum of ages of Jose and Maria is 77 Yrs.

Jose's age is 4 Years less than twice Maria's age.

Parts & whole

Find Jose's age.

Total  $\rightarrow$  77 Yrs

Jose  $\rightarrow 2x - 4$

Maria  $\rightarrow x$

Jose's age + Maria's age = 77

$$2x - 4 + x = 77$$

$$3x - 4 = 77$$

$$3x = 77 + 4$$

$$3x = 81$$

$$\boxed{x = 27}$$

$$2(27) - 4$$

$$= 54 - 4$$

$$= 50$$

Jose is 50 Yrs old.

John has a total of 77 Coins.

Nickels, Dimes, and Quarters.

The # of dimes is twice # of nickels.

The # of Quarters is 5 more than 3 times # of nickels. How many quarters does he have?

Total  $\rightarrow 77$  Coins

$$3(12) + 5$$

$$= 36 + 5$$

$$= 41$$

Parts  $\left\{ \begin{array}{l} \text{Nickels} \rightarrow x \\ \text{Dimes} \rightarrow 2x \\ \text{Quarters} \rightarrow 3x + 5 \end{array} \right.$

$$\text{Nickels} + \text{Dimes} + \text{Quarters} = 77$$

$$x + 2x + 3x + 5 = 77$$

$$6x + 5 = 77$$

$$6x = 72$$

$$x = 12$$

41  
Quarters

PTA purchased 45 tickets for a trip to a local zoo. Students & Adults only.

# of student's ticket was 5 fewer than

4 times the number of adult's tkt. How

many of each? Total  $\rightarrow 45$

Parts  $\left\{ \begin{array}{l} \text{Students} \rightarrow 4x - 5 \\ \text{Adults} \rightarrow x \end{array} \right.$

$$\text{Students} + \text{Adults} = 45$$

$$4x - 5 + x = 45$$

$$5x - 5 = 45$$

$$5x = 50$$

$$x = 10$$

10 adults  
&  
35 Students  
45 Total tickets

Moe purchased 30 wedding pictures.

Small Size and Large Size.

The number of Small Size pictures was

$\frac{2}{3}$  of the number of Large Size pictures.

How many of each? Small + Large = 30

$$\frac{2}{3}x + x = 30$$

Find total cost if Small picture is \$5 each and Large picture is \$8 each.

18 Large

12 Small

$$\text{LCD} = 3$$

$$2x + 3x = 90$$

$$5x = 90$$

$$x = 18$$

$$8 \cdot 18 + 5 \cdot 12 = \$204$$
